PostalOne!®

Release 39.1.0.1

The *PostalOne!* system Release *39.1.0 (December 22, 2014)* is deployed to introduce software fixes to the system. This includes a correction to issues previously identified in a prior release.

The content of this document is subject to change.

These Release Notes provide the contents of the release and affected subsystems.

1. USPS

PostalOne! Release *39.1.0.1* deployed on December 22, 2014 to introduce software fixes to the system. This includes corrections to issues previously identified from a previous release.

 The content of this document is subject to change.

1.1   Electronic Data Exchange

Mail.dat validation processing of Firm Bundle Periodicals (PE) submissions that are split across two Package Quantity records (PQT) has been updated to properly enforce the business rule that Firm Bundles must have more copies than pieces (DMM 207.22.3). Mail.dat validation processing has been modified to evaluate the copy and piece count totals across all associated containers (i.e., at the CQT record level) instead of evaluating the copy and piece count for each individual PQT record in scenarios where the Firm Bundle is split across two or more PQT records. Previously, a defect introduced in the November 2014*PostalOne!* system release erroneously generated an internal error for PE Firm Bundle submissions under certain conditions. The error occurred when Firm Bundles with the same package level were split across two PQT records, where one record indicated multiple copies and one piece (#copies > #pieces), and the other indicated one copy and one piece (#copies = #pieces). The latter PQT record incorrectly generated the error. 5896 (13173-R)

1.2   Electronic Verification System (eVS)

An issue has been corrected that previously prevented some manifest records from being loaded if the file version of the source manifest file was unknown. Under those circumstances, the Product Tracking and Reporting (PTR) System used a default manifest file version number (1.6); however, eVS did not use a default value, causing the records to fail the eVS load. A default manifest file version number of 1.6 is now used for records without a version number in the source manifest file. 5973 (13181-R)
